

## 50 FT. AIR HOSE REEL MOUNTING TEMPLATE AND INSTRUCTIONS

**⚠ WARNING:** Reel must be mounted to a load bearing structural member capable of supporting combined weight of the Reel, Hose, and Forces caused by pulling and maneuvering hose. Reel must be secured using (4x) 1/2" Bolts with Washers through the 4 slots in the mounting base.

1. Use 1/2" (or similar thickness) hex lag screws. The length will depend on the substrate you are going through - depending if you are going through drywall or plaster and then into the structural beam, or directly into a structural beam. (This is why hardware is not supplied as it depends on the surface.)
2. Using this template, mark the mounting bolt locations on the mounting surface.
3. Install 2 bolts with washers (without the reel) that match the 2 "open" slots in the bolt pattern template. (Note do not tighten all the way. Leave about a 1/4" (6mm) gap from the washer to surface to allow for the mounting plate thickness.)
4. Mount the reel by sliding the open mounting holes onto the pre-mounted bolts and then tighten the bolts to the reel.
5. Secure the additional 2 bolts and washers in the "open" holes and tighten to the reel.

**Please call 800-681-3791 for additional mounting questions.**
